# SUBJECT INDEX

note: t = table; f = figure

## A

- actors (nodes), 245-46, 247
- Add Health Study, 259-61, 260f, 261t-264t, 263
- additive grouping decomposibility, spatial segregation measures and, 136, 149-50
- additive spatial decomposibility, spatial segregation measures and, 136, 147-49
- adjacency matrix (sociomatrix), 247, 248f
- age effects, 76, 111
- age-period-cohort accounting model, 75-108
- age-by-period vs. cohort-by-period interactions, 111-12
- ANOVA, 112-13
- $B_0$  vector, explicit form of, 106-7
- CGLIM. *see* constrained generalized linear models estimator
- identification problem. *see* identification problem, in APC models
- intrinsic estimator. *see* intrinsic estimator
- theorem 1, 101-2, 107
- theorem 2, 102-3, 108
- theorem 3, 103-4
- three-way, 90, 91t-94t, 94

- aggregation effect, 124
- alternative hypotheses, 23
- altruistic behavior, 12
- The American Occupational Structure* (Blau & Duncan), 68
- analysis of covariance, 164
  - assumptions, 169-70
  - time-varying exposure and, 164-66, 165f
- ANOVA, 112-13, 250
- anticlericalism, 48
- APC models. *see* age-period-cohort accounting model
- arbitrary boundary independence, spatial segregation measures and, 132
- Arc/INFO, 127
- arcs, 245, 246
- ArcView GIS, 127
- artifacts, 352-53
- assessment
  - of causal effects with unmeasured confounders, 273-83
  - of sociological explanations, 22-28
- average treatment effect (ATE), 274, 277
- average treatment effect for the treated (ATT), 274, 277, 278, 283

## B

- Bacon, Francis, 37
- behavior

- altruistic, 12
- "near-constants" of, 59
- Bernoulli graph, 249
- bias
  - endogeneity, 276-77
  - in estimation of causal effects, 271-308
  - hidden, 272-73, 289-92
  - hidden populations and, 195
  - IV estimator, 282-83
  - masking, 206-7
  - propensity score matching and, 287-92
  - Rosenbaum bounds sensitivity analysis, 283
- boundary independence, of spatial segregation measures, 144-45
- Boyle's law, 38
- C
  - "canons of inductive logic," 22-23
  - Cartesian method, 36-37
  - causal effects
    - assessment with unmeasured confounders, 273-83
    - generalizations, 29
    - modes of influence, 16
    - patterns of influence, 17
    - regularity view of, 14
  - causal models, 3 . *see also specific causal models*
    - constructing, 18-19
    - deducing empirical predictions from, 30
  - causal regularities in history, 23
  - centralization, 124-25
  - CGLIM. *see* constrained generalized linear models estimator
  - chain-referral sampling, 196-97, 200, 204-8, 205f, 229, 230
  - Charles's law, 38
  - checkerboard problem, 123
  - The Cheese and the Worms* (Ginzberg), 66
  - Chinese Revolution, 27
  - Chitwan Valley Family Study, 172-73, 174t, 175
  - classes, *versus* states, 27
  - CLL. *see* conditional loglinear models for locally sampled networks
  - CLM (covering-law model), 2, 4-5, 17, 18, 28, 71, 72
  - CLUSTAN, 365
  - clustering
    - spatial segregation and, 124-27, 126f
    - of text units, automatic, 372-73
    - in word impact analysis, 359, 360f
  - cohort effects, 76
    - analysis of. *see* age-period-cohort accounting model
    - social change and, 111
  - comparative/historical research, 49
  - comparative method, 23-24
  - composition invariance, spatial segregation measures and, 133-34, 145-46
  - computer simulation
    - respondent-driven sampling, 219-20, 220f, 221f, 231-33
    - survival analysis, 176-89, 176f, 177t, 181t, 183t, 184t, 187t, 188t
  - concentration, 124-25
  - conditional loglinear models for locally sampled networks (CLL)
    - Add Health Study, 259-61, 262t, 263, 264t
    - versus* ERG models, 245, 252-53
    - generalized estimating equations and, 251
    - linking with ERG models, 245, 255-56, 257t, 258-59
    - marginal effects, 250-51
    - random graph models for complete networks, 253-55
    - saturated, 250, 251
    - ULL and, 252-53
    - uniform homophily, 251, 252t

- conditional tie independence (CTI),  
249, 250
- confirmation of models, 21
- confirmatory factor analysis model, 312
- confounders  
direct unmeasured, 186, 187t, 188  
endogenous time-varying, 164-66,  
165f, 189  
unmeasured, 190, 273-83  
weighting method for, 189
- conjunctive explanation, 17-18
- constants of nature, 59
- constrained generalized linear models  
estimator (CGLIM)  
age, period and cohort effects, 94-96,  
95f  
asymptotic behavior of, 103-4  
bias and, 100-101  
constraints, 81, 84-85  
identification problem solution,  
113-18  
versus intrinsic estimator, 77-78,  
86-87, 87t, 88t, 89f, 90, 104-5,  
114-18  
likelihood ratio test statistics, 94, 94t  
*Constructing Social Theories* (Stinchcombe), 4
- constructive realist model (CRM), 45-46  
versus deductivism, 16  
of explanation, 15-19  
historical sociology and, 63-68  
theory in, 18  
"context of discovery"\*, 26  
"context of justification," 26  
Copernicus, 37
- correlated traits and uncorrelated  
methods (CTUM), 312-13
- covariance analysis, time-varying  
confounding, 164-66, 165f,  
181-82, 181t, 189
- covariate balance, propensity score  
matching and, 286, 286t
- covering-law model (CLM), 2, 4-5, 17,  
18, 28, 71, 72
- CRM. *see* constructive realist model
- CTI (conditional tie independence),  
249, 250
- CTUM (correlated traits and uncorrelated  
methods), 312-13
- D
- death rates. *see* mortality rates
- decision support systems (DSS),  
368-69, 368f, 370t
- deductive-nomological explanations  
(D-N), 5, 7
- deductive reasoning, 38
- deductive-statistical explanations (D-S),  
5
- deductivism, 24, 37  
assumptions, basic, 14-15  
versus constructive realist model, 16  
definitions of, 72  
failings of, 18-19  
Goldstone's use of, 72  
holistic version, 9-12  
as methodological prescription, 22  
normative methodology and, 28  
probabilistic version, 12-15  
as standard model, 3-8, 35  
uses/abuses of, 28-30  
varieties of, 71-73
- degenerating research programs, 9-10
- Descartes, 36-37, 42
- Detroit Area Study, 242
- directed relations, 246
- dissimilarity index (D), 122, 138
- distance-decay effect, 136
- D-N (deductive-nomological explanations), 5, 7
- D-S (deductive-statistical explanations),  
5
- DSS (decision support systems),  
368-69, 368f, 370t
- Durkheim, Emile, 39
- dyadic independence, 249
- dyads, 246

## E

- edges, 245, 246
- Einstein, 38
- empirical adequacy of theories, 19–20
- empirical-inductive method
  - advantages of, 42, 45
  - combining with rational-deductive method, 71–72
  - versus rational-deductive method, 38–39
- empiricism, excessive, 71–72
- endogeneity bias, 276–77
- entropy-based information theory
  - index ( $H$ ), 122
- ERG models. *see* exponentially parameterized random graph models
- Essay Concerning Human Understanding* (Hume), 3–4
- estimation, 229–30
  - respondent-driven sampling for, 207–8, 208–19
  - with split-ballot MTMM design, 325–27
  - standard techniques, 194, 195
  - using social network for, 201–4, 202f
- European Social Survey, 314, 314f, 315t, 319t
- evenness. *see also* clustering
  - aspatial, 125
  - spatial, 124–25, 125, 138, 141, 142t, 143
- exchanges, spatial segregation measures and, 135, 146–47
- exemplars, of theory, 49
- experiment
  - deductive method and, 37–38
  - inductive method and, 36
- explanations
  - assessments of, 22–28
  - as causal models, 28–29
  - competing, supporting evidence for, 21
  - conjunctive, 17–18
  - constructive realist model of, 15–19

- ecological or meso, 46
- individualistic or micro, 46
- interactive, 18
- intermediate processes and, 47
- macrosociological or holistic, 46–47
- narrative claims and, 47
- ontological claims of, 20
- scientific, 5–6
- in “soft” science, 6
- without laws. *see* constructive realist model
- explanation sketches, 5
- explanatory models, 3
- explanatory realism, 19–22
- exponentially parameterized random graph models (ERG), 243
  - Add Health Study, 259–61, 262t, 263, 264t
  - versus CLL, 252–53
  - linking with CLL, 245, 255–56, 257t, 258–59
  - Markov random graph, 244, 245
- exposure, 164
  - aspatial vs. spatial, 125–26, 126f
  - spatial exposure segregation index, 137
  - spatial segregation and, 124–25
- exposure index ( $P^*$ ), 122
- exposure-response relationship
  - endogenous confounders, 165–66, 165f
  - weighted survival analysis method, 166–69, 168t, 169t
- extensions, of theory, 49–50

## F

- falsificationism, 2, 3
  - logical, 14
  - of observational claim, 21
- Popperian, 4
- probabilistic, 12–15
- rate of, 22
- fatigue effect, 320
- finite-time-period analyses

- intrinsic estimator *versus* CGLIM, 102
- unbiased intrinsic estimator and, 101-2
- fitting nonparametric models
  - using covariance analysis, 189
  - using weighting method, 189
- fixed-effect generalized linear models, 79
- forks (fans), 17
- frequency distribution, 13
- friendship data, Add Health Study, 259-61, 260f, 261t-264t, 263
- functionalism, 2
- G
- Galileo, 29
- generalized linear models (GLIM)
  - APC models and. *see* age-period-cohort accounting model
  - with identifying constraints, 90, 91t-94t, 94
- general laws, scientific, 6
- General Social Survey, 242
- geographical information system (GIS), 127
- GLIM. *see* generalized linear models
- grand theory, 18
- graph models
  - CLL. *see* conditional loglinear models for locally sampled networks
  - ERG. *see* exponentially parameterized random graph models
- graphs
  - Bernoulli, 249
  - conditional tie independence, 249, 250
  - dyadic independence, 249
  - of network data, 247, 248f
- gross effects models, 90
- grouping variable, 280, 282
- H
- Hansen-Hurwitz based estimator, 217-18
- "hard" science, explanations in, 6
- HDM. *see* hypothetico-deductive model
- hidden bias, 272-73, 289-92
- hidden populations
  - chain-referral sampling for, 196-97
  - data collection problems, 195-96
  - respondent-driven sampling, 200-201, 200f, 208-19
  - sampling bias and, 195
  - targeted sampling, 196, 198
  - time-space sampling, 196, 198-99
  - traditional sampling methods, 198-200, 200f
- hierarchical categorization, principles, 351
- historical sociology
  - choosing explanations in, 44-50
  - constructive realism and, 63-68
- holism, 9, 11
- hypothetico-deductive model (HDM), 2, 28, 72
  - reformulated versions of, 3
  - standard version, 4-5, 8, 9
- I
- identification problem, in APC models
  - conventional solution approach, 81
  - description of, 77, 78-80
  - intrinsic estimator solution approach, 81-86
  - linear regression form, 78
- IE. *see* intrinsic estimator
- inductive-empirical methods, 40
- inductive reasoning, 38
- inductive-statistical explanations, 6, 7
- inductivist method, 24
- instrumental variable sensitivity analysis
  - versus* Rosenbaum bounds method, 272-73, 300-302
  - with Rosenbaum bounds method, 279-80
- instrumental variables estimators (IV), 272-73

- bias, 282-83
- LATE and, 276-77
- omitted variable bias in OLS and, 280-81
- interactive explanation, 18
- interpretive research, 349-50
- intrinsic estimator (IE)
  - age-period cohort accounting model, 77
  - asymptotic property of, 103-4
  - bias and, 100-102
  - versus CGLIM, 77-78, 86-87, 87*t*, 88*t*, 89*f*, 90, 97-100, 98*t*, 99*f*, 104-5, 114-18
